## HISTORY OF FLIGHT

A flight of six (6) 1-106A aircraft were enroute from Tyndall Air Farce Base, Florida to Castle Air Force Base, California, after a routine Flight Deployment for Weapons Training. The flight flew from Tyndall AFB, Florida to Andrews AFB, Md. 17 May 1961. The flight of six (6) aircraft departed Andrews AFB, Md. on a DD 175 aircraft clearance at 1400Z 18 May 1961; using the call sign "UH 26" flight enroute to Duluth Minicipal Airport, Minnesota (See Tab M). The route of flight was from Andrews AFB, Md. direct to Merndon TACAN, direct to Pittsburgh TACAN, direct to Cleveland TACAN, direct to Pullman TACAN, direct to Milwaukee TACAN, direct to Duluth TACAN. The estimated time enroute was one hour and 55 minutes. All aircraft had 9,945 pounds of fuel aboard at take-off with 2 hours 30 minutes of fuel on board. The weather at the time of the DD form 175 briefing for Duluth was 1700 feet broken, 3000 broken, 6000 overcast, visibility 7 miles, surface wind from the Morth at 7 miles. The forecast weather for Duluth was 6000 feet overcast, visibility 10 miles.

It Colonel James L. Price briefed the flight prior to take-off.
Deluth was selected as the best P-106A Base to fly to from Andrews AFB
as weather conditions were unsatisfactory on any other route proceeding
Nest. Prior arrangements were made with the Chief of Maintenance of
the 3A3rd Pighter Group via telephone hot line to turn around the six
P-106A aircraft here, as Duluth is an Mofficial Business Only base.
Persission was granted. The NOTAKS for Duluth were checked and noted.
From the pilots testimony, they were aware that the first 1,000 feet
of runney at Duluth is classified as overrun and that downdrafts can
occur at the approach end of runney 27 (see Tabs Pl & P2). They appeared familiar with the BAK-6 jet barriers at Duluth. The flight was
briefed for two (2) three (3) Normation take-offs at Andrews AFB with
a VFR traffic pattern to be accomplished at Duluth.

The DD form 175 indicated the following pilots! and aircraft positions within the flight: (see Tab M).

Call Sign	Name	F-106A aircraft number
UH 26 UH 26A UH 26B UH 26C UH 26D	It Col James I. Price Capt William A. Curnutte Capt Robert A. Hamblin Capt Keith R. Young Capt Donald N. Orth	59-117 59-140 59-125 59-138 59-146
UH 26E	1/It Everett E. Denoklau	59-139

The flight remained in two elements with UH 26 leading the first flight and UH 26C leading the second element about one mile behind, but within easy visual contact. The flight continued as briefed. At the leading the manufacture of the briefs of the leading the first second element about one mile behind, but within easy visual contact. The flight continued as briefed. At the leading the first second element of the behind of the leading the first second element about one mile behind, but within the leading the first flight continued as briefed.

This was lower than anticipated as indicated in the pilots' statements (see Tabs G, K & M). The flight continued to Duluth.

Duluth Air Defense Sector (call sign Majority) was contacted fortyeight (AS) wiles Southeast requesting a SAGE-GCA straight-in penetration as they were short on fuel (see Tabs 0-1). The flight was approaching Duluth from a south-easterly dection. The Intercept Director at Majority informed UH 26 that the active runway was 09. However, he stated that the surface winds were from the east at three (3) miles. Would they accept an "Mast Cate" approach to Runway 27 for landing. An East Cate approach and landing was accepted by UH 26. UH 26 them split the six (6) aircraft flight in two (2) elements of three (3) aircraft for the weather penetration and approach. Meanwhile Majority Intercept Director technician was contacting Duluth tower for the approach elearance to the East Cate and landing on runway 27. Runway 09 was the active runway and Duluth tower questioned the requested clearance but approved it upon learning of the fuel shortage problem. The intercept Director Technician contacted Duluth GCA for a precision approach to runway 27. Duluth GCA questioned the reason for a CCA to runway/and adject that only a surveillance approach would be available for this approach (see Tab 01). The Intercept Director contacted UH 26 flight, composed of UH 26, UH 26A, and UH 26B and UH 26C flight, composed of UH 26C, UH 26A and UH 26B and UH 26C flight, composed of UH 26C and UH 26 flight ecentinued inbound under GCA control until about five (5) miles out. It this time they were VFR and had the base in sight. UH 26 flight describined inbound under GCA control until about five (5) miles out. It this time they were VFR and had the base in sight. UH 26 flight describined the GCA and contacted Duluth Tower for landing instructions. The flight made a normal VFR evertead traffic pattern to runway 27 with three second spacing on the pitch out. UH 26, UH 26A and UH 26B landed without incident.

At the time UH 26 flight was penetrating for their SACE-CCA approach, UH 26C flight was given some spacing turns while waiting for their penetration and approach. UH 26C contacted Majority and asked for a penetration soon, as they were low on fuel (see Tab Cl). About this time, or shortly before, approximately 50 miles East of Duluth, UH 26C relinquished lead of the flight to UH 26D as he was the only aircraft in this three ship flight with accurate TACAN equipment operating (see Tab I2). Majority put UH 26C flight in a penetration to the East Cate. UH 26E, in UH 26C flight, asked if it was to be a formation landing (see Tab G). UH 26C was now on the left wing of UH 26D who was leading. He advised against it due to runway width and said the high wan on fuel would break out of traffic at CCA minimums and make a closed traffic pattern. After a fuel check UH 26C said that he would make the closed pattern, leaving UH 26D leading UH 26E in on his right wing in formation for the full stop landing.

Majority turned UH 26C flight over to GCA for the surveillance approach. About four (4) miles out on the approach, GCA radio transmissions with GCA were unreadable. UH 26D had his flight change to tower frequency for a straight-in full stop landing. UH 26D told UH 26C to start his go-around and closed pattern at about one and one-half (12) miles which he did. UH 26D with UH 26E continued straight in. UH 26D indicated that his final approach speed was 200 knots indicated (see Tab 13). From the statements of witnesses; this flight appeared extremely low on the final approach (see Tabs 14, 15, 16). Lieutenants Showliter and Krans, two qualified Y-106A pilots on alert duty, were observing the landing from their position in the Alert Hangar (see Tabs 15, 16). They indicated that UH 26D landed about 50 feet down on the 95 foot black top blast pad at the end of the overrun. UH 26E touched down 51 feet short of the black top blast pad on the incline leading

a Mest

up to the overrun (see Tabs Q diagram 2 & Tab R). UH 26E burst into flames immediately upon impact, driving both main landing gear into the wings. The landing gear then sheared from the aircraft (see Tab Q diagram 2). The aircraft sli. up on to the overrun and continued to slide down the runway shedding pieces and spraying the runway with fuel (see Tab Q diagram 1). The BAK-6 barrier supported by rubber groumets, located 530 feet from the runway threshhold, was in position. This was not taken down prior to the landings as there was insufficient time for the service crew to remove it. The runway landing direction was changed only for these six (6) aircraft. UH 26E slid over this BAK-6 barrier apparently snapping the cable upon passing over it. UH 26E began veering to the left, leaving the runway 3,100 feet from the threshhold lights. He continued to slide another 400 feet and came to a rest 150 feet left of the runnay, 20 degrees from the runnay heading (see Tab Q diagram 1). While the aircraft was sliding, Lt. Deneklau the pilot, unfastened the two (2) parachute clasps to release him from the rotational upward ejection Type B seat and the incorporated parachute. After stopping, It. Dencklau started to open the canopy normally. He then noted the flames and decided to jettieon the canopy which departed the aircraft when he raised the ejection lever on the left side of the seat. He immediately raised himself out of the seat and abandoned the aircraft over the right side. He was met by the fire department who turned him over to the flight surgeon a few minutes later (see Tab G). The fire department responded almost immediately to the tower alert call of the crash, managed to control the fire, eventually extinguishing it completely. UH 26D continued his landing roll uneventfully. UH 26C circled the base until the runway was cleared of the major portions of the debris. He then landed without incident.

eggicken.

F-106A

59-139 61-5-18-1

## FINDINGS

The board having carefully considered the evidence before it finds that:

## PRIMARY CAUSE:

1. The primary cause of this accident was supervision, in that the element leader misjudged his final approach and touchdown point for an F-106 formation landing, causing his wingman to touchdown short and below the level of the runway overrun.
