

# F-106A TECHNICAL DATA

## Mission and Description

Navy Equivalent: None Mfr's Model: 8-24

The principal mission of the F-106A is the interception and destruction of attacking enemy aircraft and airborne missiles, having all weather and day or night characteristics.

This airplane incorporates a delta wing with a cambered leading edge extending from wing root to wing tip and swept tail surface. Control surfaces are power operated.

The fuel system is pressurized, air is bled from the engine compressor section and is used to pressurize the fuel tanks to reduce fuel evaporation and to provide for fuel transfer and CG control inflight.

The airplane has the capability for air refueling from flying boom equipped tankers.

Armament consists of four AIM missiles and an AIR-2 rocket or, on some airplanes, a gun system replaces the AIR-2 rocket. All armament is contained in a missile bay in the bottom portion of the fuselage. Firing of the armament is either manual or automatic. The components of the MA-1 Aircraft and Weapons Control System provides automatic radar searching and tracking, directs the airplane on a lead-collision attack and automatically fires the armament.

External fuel tanks can be added to increase range. The tanks can be refueled in flight and need not be jettisoned for combat since they do not restrict airplane speed or load factor when empty.

## Development

Similar to the F-102A except for the J75 engine in lieu of the J57, redesigned tail, addition of fuselage fuel tanks, armament changes, and completely new electronic system.

Previously designated F-102B.

# F-106B TECHNICAL DATA

## Mission and Description

Navy Equivalent: None

Mfr's Model: 8-27

The principal mission of the F-106B is to function as a pilot proficiency training while maintaining full tactical capabilities for the interception and destruction of hostile aircraft and missiles. The F-106B has all-weather and day or night characteristics.

This airplane incorporates a delta wing with a cambered leading edge extending from wing root to wing tip and swept tail surface. Control surfaces are power operated.

The fuel system is pressurized, air is bled from the engine compressor section and is used to pressurize the fuel tanks to reduce fuel evaporation.

The airplane has the capability for air refueling from flying boom equipped tankers.

The armament is located in a bay in the bottom of the fuselage. The AIM missiles are extended below this section for firing and the AIR-2A rocket is ejected from the bay by an explosive charge. Firing of the armament is either manual or automatic. The components of the AN/ASQ-25 (MA-1 equivalent) Aircraft and Weapons Control System provides automatic radar searching and tracking, directs the airplane on a lead-collision attack and automatically fires the armament.

External fuel tanks can be added to increase range. The tanks can be refueled in flight and need not be jettisoned for combat since they do not restrict airplane speed or load factor when empty.

## Development

Basically the same as the F-106A except for redesign of the cockpit to accommodate two pilots, redesign of the fuselage fuel tank area and installation of a comparable electronic system.

First flight (prototype) . . . . . Apr 58  
 First flight (production) . . . . . Oct 58  
 Production status . . . . . Production Completed
